

## Report Guidelines

Please use the official assignment template (which includes a plagiarism declaration form) available from [um.edu.mt/ict/cis/students/resources](http://um.edu.mt/ict/cis/students/resources). You are to adopt the IEEE referencing style. The report should be around 25 pages long excluding the bibliography and any appendices.

In your documentation, you are to include a signed teamwork declaration, including responsibilities taken up by each team member at any point in time as well as a detailed description of contributions made by each team member towards the project's final outcome. **Each team member's work is to be presented as a clearly indicated (by name), delineated, and contiguous part of the group's report. Therefore, apart from the common sections of the report, the group's report is expected to consist of separate sections written by each team member. Please bear in mind that if individual work cannot be clearly and easily recognised and appreciated by examiners, then this may have a negative impact on the group's final mark.** An overview of group dynamics throughout the project should also be provided (i.e. overall experience, issues encountered, how these were resolved etc...). The meeting log sheet (project and supervisory meetings) should also be included in your documentation (e.g. as an Appendix).

The following is a guide of what is expected in your documentation:

1. Task definition
2. Research into the matter(s)/domain(s) relating to task(s)
3. Overview of any similar and/or existing solutions
4. The proposed solution (considering the preceding the three points)
5. Task breakdown (including distribution among group members)
6. Project plan and/or methodology of work
7. Specification and design, including (where and if applicable)
  - a. Principal system components and architecture
  - b. Data model and architecture
  - c. Infrastructure details (e.g. services, hardware and software used, protocols, external libraries, and reused/reusable components)
  - d. User interface design (if applicable)
  - e. Non-functional properties, such as (where applicable), usability, performance and security considerations (i.e., access control, robustness, backup and recovery considerations)).
8. Evaluation (requirement coverage, testing strategy and results)
9. Conclusions and future work
10. Acknowledgements
11. References
12. Appendices (incl. meeting logs)
